README

- Ensure the PyQt6 library is installed in order to run the code.
- In SQL Server Management System, create a new database called 'NEW_SOLASTA'
- Open the 'new_database_creation.sql' file and execute it in the database in order to create and populate the tables.
- Ensure the necessary permissions and configurations are given by the SSMS
- Open the project files in any IDE and change the connection string in each python file (according to your system details).
- Run the welcome.py file to run and open the entire project.
